Credits, corrections and connected data

Review the application, not just the extracted amount

GA in update 29.1; prerequisites still apply.

Payables Agent creates an unposted purchase credit memo and does not post it. Check document language and Copilot Credits requirements. Classification uses document content, not merely a negative amount.

Update 29.1; English supported/validated; no universal rollout assertion.

What is new in Business Central update 29.1

Payables Agent

Ambiguous references and warnings need a decision

A suggestion is not a complete settlement instruction.

A unique eligible open invoice can be suggested. Multiple references or matches require attention. Excess-credit and other unposted-credit warnings do not block finalization; finalization respects the reviewed selection and rechecks eligibility.

Current documentation checked November 12, 2026.

Process incoming purchase credit notes

Select the G/L entries before proposing a correction

Established standard capability, not a new November announcement.

Dimension correction changes selected G/L entries, not corresponding subledgers. Agree the reporting scope, permission and permitted values. Changing selection resets proposed changes. Validate before immediate or scheduled execution.

Established capability.

Correct dimensions on posted G/L entries

Follow the reporting consequences

Completion of the correction is not confirmation every report is aligned.

Review history and analysis-view updates. Only the latest correction can be undone. Cost accounting requires separate identification of the affected model and appropriate reprocessing; do not assume every related ledger follows the G/L correction.

Established capability.

Correct dimensions on posted G/L entries

Verify the three Fabric states

Production-ready preview remains preview.

Check compatible extension and required access, then distinguish connection setup, BC export results and Fabric ingestion. Inspect eligible tables and actual package/manual selection. Finishing the guide is not synchronization.

Production-ready preview; current guidance updated November 6, 2026.

FAQ about Business Central mirroring to Fabric

Set up Business Central data mirroring to Microsoft Fabric

Manage Business Central synchronization with Microsoft Fabric

Monitor and troubleshoot Fabric synchronization

Monitor before choosing a reset

A zero-change row may carry an error.

Show zero-change rows during investigation. Use client Details for run-bound results; the detail API lacks run ID. Stop preserves state; full Reset removes connection/watermarks and synchronization overview/detail history. Reset table requests a snapshot and is not schema repair. Stop active synchronization and confirm it has stopped before Reset table.

Preview; no tenant test or latency guarantee.

A mixed key is a design option, not a performance result

Business Central 29/runtime 18.

A table-extension key can combine base fields with its own extension fields. An example queue filters by base date and extension processing status. Evaluate the actual read and write workload; no benchmark is claimed.

2026 release wave 2/runtime 18.

Table keys in AL

Keep field ownership and target version explicit

Optional developer detail.

Mixing covers KeyFields, SumIndexFields, SqlIndex and IncludedFields. Fields from another table extension remain excluded; Unique and Clustered remain unsupported. Use the explicit versioned documentation and compile/test for the intended target. An older example comment on the same page conflicts with the newer runtime 18 clause.

2026 release wave 2/runtime 18; not retroactive to older targets.

Table keys in AL

Preserve planning context before November15

A roadmap-site transition, not Business Central retirement.

Microsoft schedules Release Planner retirement by November 15, 2026. Personalized views do not migrate; preserve the planning information needed to reconstruct the routine. Product schedules remain unchanged; use Learn for implementation and Message Center for tenant notices.

Announced transition by November 15, 2026; no exact shutdown time asserted.

One always-on roadmap: transition milestones
